Applicant(s)

TAKEMOTO ET AL.

Examiner

Jeffery A. Brier

Art Unit

2628

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 06 June 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-3 and 5-18 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3 and 5-18 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/CDC)
- 4) ☐ Interview Summary (PTO-413)
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____
- Paper No(s)/Mail Date _____

DETAILED ACTION

Response to Amendment

1. The amendment filed on 06/06/2008 has been entered. The amendments to the claims overcomes the 35 USC 112 first paragraph rejection set forth in the office action mailed on 03/06/2008.

Response to Arguments

2. Applicant's arguments filed 06/06/2008 have been fully considered but they are not persuasive.

The arguments concerning the new matter objection to the specification is not persuasive. The amendment filed 01/07/2008 is objected to under 35 U.S.C. 132(a) because it introduces new matter into the disclosure. 35 U.S.C. 132(a) states that no amendment shall introduce new matter into the disclosure of the invention. The added material which is not supported by the original disclosure is as follows: Changing "real object" to "operating unit" is not supported by applicants originally filed specification.

The "operating unit" language added to the specification corresponds to "operating unit 1090" of applicants specification which does not measure position and orientation of a plurality of positions in real space "for setting a constraining shape by using a shape generated based on the inputted three-dimensional position information in case of the input of the constraining shape" (01/07/2008 specification amendment). Applicants specification in paragraphs 30, 31, 32, 44, 69, 82, 83, 84, and 85 discuss operation unit 1090 as controlling the virtual object and in paragraphs 28, 30, 42, and 50

discuss stylus 1060 as setting the position and orientation of a plurality of positions in real space used "for setting a constraining shape by using a shape generated based on the inputted three-dimensional position information in case of the input of the constraining shape". The specification does not convey the operating unit 1090 is moved to measure the three-dimensional position information used "for setting a constraining shape by using a shape generated based on the inputted three-dimensional position information in case of the input of the constraining shape" (01/07/2008 specification amendment).

Applicant is required to cancel the new matter in the reply to this Office Action.

The argument concerning Kitamura is not persuasive because an estimation of the 6DOF position and orientation would have been obvious to one of ordinary skill in the art when the 6DOF is used to take an "image" of the real world object because the digital representation of the position and orientation of the points of the image sensed by the 6DOF are an estimation of the actual points and orientation of the points of the image sensed by the 6DOF. Thus, when one of ordinary skill in the art uses the 6DOF to take an "image" of the real world object than an estimation of the position and orientation of the image capturing means or unit and setting of the constraining shape is performed because this will allow the user to "bring a real object into a virtual world", page 133 column 1 lines 18-23 of the abstract and page 134 column 1 last sentence of the first paragraph of section 2. Also note the discussion of using the manipulator, 6DOF, to form a constraining plane at page 136 column 1 lines 8-11 and figure 2.

With regard to the amendment to claims 3 and 18 note Kitamura at page 137 column 1 lines 1-3.

Thus, the new matter rejection is maintained and reproduced below and the 35 USC 103 rejection based upon Kitamura is maintained and set forth below with modification to reflect claim amendments.

Claim Rejections - 35 USC § 112

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

4. Claims 10-15 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 10:

At line 4 "estimating the position and orientation" is claimed and at line 8 "measuring the position and orientation" is claimed and at lines 12 and 13 position and orientation information is used but are unclear which position and orientation information, "estimated" or "measured", is used. Also unclear is whether the "estimated" and "measured" position and orientation information are the same or different position and orientation information.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating

obviousness or nonobviousness.

7. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

8. Claims 1-3 and 5-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yoshifumi Kitamura and Fumio Kishino, Consolidated Manipulation of Virtual and Real Objects, September 1997, Proceedings of the ACM symposium on Virtual reality software and technology, pages 133-138. Kitamura teaches an augmented reality system that uses object constraints to control the visual interaction between the virtual objects and the real objects.

A detailed analysis of the claims follows.

Claim 10:

Kitamura teaches an information processing method for changing the position and orientation of a virtual object in mixed reality space obtained by combining a real space and a virtual space, said method comprising the steps of:

Kitamura does not fully teach:

an estimating step of estimating position and orientation of an image capturing means *(An estimation of the 6DOF position and orientation would have been obvious to one of ordinary skill in the art at the time of the invention when the 6DOF is used to take an "image" of the real world object as discussed below because the digital representation of the position and orientation of the points of the image sensed by the 6DOF are an estimation of the actual points and orientation of the points of the image sensed by the 6DOF. Thus, when one of ordinary skill in the art uses the 6DOF to take an "image" of the real world object as discussed below than an estimation of the position and orientation of the image capturing means or unit and setting of the constraining shape is performed because this will allow the user to "bring a real object*

into a virtual world”, page 133 column 1 lines 18-23 of the abstract and page 134 column 1 last sentence of the first paragraph of section 2. Also note the discussion of using the manipulator, 6DOF, to form a constraining plane at page 136 column 1 lines 8-11 and figure 2.);

Kitamura further teaches:

obtaining three dimensional position information of a plurality of positions designated by an input unit moved by a user in the real space (In view of page 135 first paragraph under the heading of 5 Consolidated Manipulation Environment of Kitamura the same 6 DOF tracker device is used to control the position of a virtual world object(s) and to control the position of a constraining real world object(s) which is similar to applicants system where stylus 1060 is used to control the virtual world object(s) and to control the location of the constraining real world object(s), see applicants paragraphs [0028], [0030], and [0041]. The 6 DOF has a stylus the user moves which meets the “operating unit moved by a user in the real space” claim limitation.), the input unit being capable of measuring the position and orientation in the real space (The 6 DOF measures position and orientation in real space of the stylus on the 6 DOF.);

determining an input of a constraining shape or an operation of the virtual object (The system determines if a shape having constraints is being input for the real object such as a toy block (section 4.1) or surface (section 5.4) or such as moving the real object which has a constraining shape and the system determines if the user is moving the virtual object.);

Kitamura does not fully teach:

obtaining a constraining shape by using a shape generated based on the obtained three-dimensional position information in the case of the input of the constraining shape (*The first paragraph in section 5 on page 135 describes the user using a 6 DOF tracker device to manipulate the virtual world objects and to position the constraining real world objects. The shape of the real world object(s) are used to constrain the movement of the virtual world object(s) by giving the real world object(s) a shape that the virtual world object(s) interacts with in a constrained manner. A step of inputting the shape of the real world objects constraining shape is inherently present.*).

Kitamura's use of the 6 DOF tracker device to control the position of the real world object suggests using the same 6 DOF tracker device to input the constraining shape of the real world object since this would require less input devices for the user to use and learn how to use. Additionally section 2 at lines 7-14 states "To bring an object that already exist in the real world into a computer-generated virtual world, it is necessary to construct accurate shape representation of the real object in a computer system. A traditional method for this is to use conventional modeling software after precisely measuring the size or length of the real object by hand." which suggests using a computer input device to measure the real object in order to have accurate shape representation of the real object's constraining shape. Thus, it would have been obvious to one of ordinary skill in the art at the time of applicants invention to input with the 6 DOF tracker device the 3D coordinates of the constraining shape because the toy block (section 4.1) or surface (section 5.4) need to have their respective constraining

coordinates input in order for the virtual object to properly interact with the real objects since this will require less input devices for the user to use and learn how to use and because section 2 at lines 7-14 suggests using a computer input device to measure the real object in order to have accurate shape representation of the real object's constraining shape. To one of ordinary skill in the art the position and orientation of the real objects that will be interacted with the 6 DOF tracker would be efficiently known in advance by using the 6 DOF tracker to measure the real object by the user moving the 6 DOF tracker "by hand". KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007), U.S. Supreme Court No. 04-1350 Decided April 30, 2007, 127 SCt 1727, 167 LEd2d 705.;

Kitamura further teaches:

changing the position and orientation of the virtual object according to instructions from the user, based on the obtained constraining shape as constraint condition in case of the operation of the virtual object (*The first paragraph in section 5 on page 135 describes the user using a 6 DOF tracker device to manipulate the virtual world object(s). The shape of the real world object(s) are used to constrain the movement of the virtual world object(s) by giving the real world object(s) a shape that the virtual world object(s) interacts with in a constrained manner. Sections 5.1 to 5.4 discusses manipulation of the virtual world object based upon constraint conditions based on the shape of the real world object in response to the user using the 6 DOF tracker device. The constraining shape generated from the three-dimensional position information constrains the interaction of the virtual world object with the real world*

object, see sections 2, 4 to 5.4. The introduction on page 133 second full paragraph discusses augmented reality which synthesizes a virtual object with a real object.

Section 5.1 discusses after movement is detected by the 6DOF manipulator the virtual object is moved according to the constraints.); and

combining an image of the virtual object generated according to the changed position and orientation, and the real image (The introduction on page 133 second full paragraph discusses augmented reality which synthesizes a virtual world object with a real world object. Section 5.1 discusses after movement is detected by the 6DOF manipulator the virtual world object is moved according to the constraints of the real world object. Sections 2, 4, and 5 discusses mixing the virtual and real world images of virtual and real world objects.).

Claim 11:

Kitamura teaches an information processing method according to Claim 10, further comprising the step of combining a virtual image indicating the constraining shape with the real image (The introduction on page 133 second full paragraph discusses augmented reality which synthesizes a virtual object with a real object. Section 5.1 discusses after movement is detected by the 6DOF manipulator the virtual object is moved according to the constraints. Sections 2, 4, and 5 discusses mixing the virtual and real world images of virtual and real world objects.).

Claim 12:

Kitamura teaches an information processing method according to Claim 10, wherein the constraining shape is a plane. (On page 136 in the text above figure 2

discusses determining a plane and using the plane to constrain movement of the virtual object is discussed with regards to figure 2.).

Claim 13:

Kitamura teaches an information processing method according to Claim 10, wherein said changing step includes changing the position and orientation of the virtual object by changing the position and orientation of the operating unit (*The 6 DOF tracker device is an operating unit. The user using the 6 DOF tracker device manipulates the virtual objects by changing the position and orientation of the 6 DOF tracker device.*).

Claim 14:

Kitamura teaches a computer program product comprising a computer readable medium storing computer program code for performing the information processing method according to Claim 10 wherein the information processing method is executed by a computer device (*This article is directed to computers that generate the augmented reality scene since it was published by ACM for a symposium on virtual reality software and technology and since at page 133 in the last sentence in the second paragraph of section 1 "software/hardware" is discussed. Software causing a computer to perform Kitamura's augmented reality is inherently stored in a computer readable recording medium.*).

Claim 15:

Kitamura teaches a computer-readable recording medium, storing the computer program according to Claim 14 (*Software causing a computer to perform Kitamura's augmented reality is inherently stored in a computer readable recording medium.*).

Claim 16:

The functions of Kitamura corresponds to the claimed units because the software causes the computer to become a unit that performs a process. As seen below Kitamura performs the claimed processes.

Kitamura teaches an information processing device for aiding control operations relating to controlling the position and orientation of a virtual object, said device comprising:

an image capturing unit configured to capture a real image in real space (*The measurements by the user in three dimensional real space, the device for obtaining the 3-D shape by using a range image, and the device for obtaining the 3-D shape by using multiple cameras captures a real image in real space. The three paragraphs found in section 2 on page 134 of Kitamura teaches the user measuring the real objects, a device measuring the real objects with range in response to the user, or a device measuring the real objects with multiple cameras range in response to the user. The claim does not limit the form of the real image, thus, Kitamura teaches this limitation. Note applicants paragraph [0024] does not restrict the image capturing unit to a particular type*);

Kitamura does not fully teach:

an estimating unit for estimating the position and orientation of said image capturing unit (*An estimation of the 6DOF position and orientation would have been obvious to one of ordinary skill in the art in the art at the time of the invention when the 6DOF is used to take an "image" of the real world object as discussed below because*

the digital representation of the position and orientation of the points of the image sensed by the 6DOF are an estimation of the actual points and orientation of the points of the image sensed by the 6DOF. Thus when one of ordinary skill in the art uses the 6DOF to take an "image" of the real world object as discussed below than an estimation of the position and orientation of the image capturing means or unit and setting of the constraining shape is performed because this will allow the user to "bring a real object into a virtual world", page 133 column 1 lines 18-23 of the abstract and page 134 column 1 last sentence of the first paragraph of section 2. Also note the discussion of using the manipulator, 6DOF, to form a constraining plane at page 136 column 1 lines 8-11 and figure 2.);

Kitamura further teaches

a virtual image generation unit configured to generate a virtual image of a virtual object according to the position and orientation of said image capturing unit (Kitamura discusses in section 2 in the first paragraph using conventional modeling software after precisely measuring the size or length of the real object by hand or by the devices which is an generation unit capable of generating three-dimensional positional information.

Sections 2, 4 and 5 discuss generating a virtual image(s) of a virtual object(s).;

a superimposing unit configured to superimpose the generated virtual image with the captured real image (Sections 2, 4, and 5 discusses mixing the virtual and real world images of virtual and real world objects.);

a determination unit configured to determine an input of a constraining shape or an operation of the virtual object (The system determines if a shape having constraints

is being input for the real object such as a toy block (section 4.1) or surface (section 5.4) or such as moving the real object which has a constraining shape and the system determines if the user is moving the virtual object.);

an inputting unit configured to input three-dimensional position information of a plurality of positions inputted by a moving an operating unit in the real space by a user (*In view of page 135 first paragraph under the heading of 5 Consolidated Manipulation Environment of Kitamura the same 6 DOF tracker device is used to control the position of a virtual world object(s) and to control the position of a constraining real world object(s) which is similar to applicants system where stylus 1060 is used to control the virtual world object(s) and to control the location of the constraining real world object(s), see applicants paragraphs [0028], [0030], and [0041]. The 6 DOF has a stylus the user moves which meets the "moving a real object limitation in the real space by a user" claim limitation.*), the operating unit being capable of measuring the position and orientation in the real space (*The 6 DOF measures position and orientation in real space of the stylus on the 6 DOF.*);

Kitamura does not fully teach:

a setting unit configured to set a constraining shape by using a shape generated based on the inputting three-dimensional position information in the case of the input of the constraining shape (*The first paragraph in section 5 on page 135 describes the user using a 6 DOF tracker device to manipulate the virtual world objects and to position the constraining real world objects. The shape of the real world object(s) are used to constrain the movement of the virtual world object(s) by giving the real world object(s) a*

shape that the virtual world object(s) interacts with in a constrained manner. A step of inputting the shape of the real world objects constraining shape is inherently present.).

Kitamura's use of the 6 DOF tracker device to control the position of the real world object suggests using the same 6 DOF tracker device to input the constraining shape of the real world object since this would require less input devices for the user to use and learn how to use. Additionally section 2 at lines 7-14 states "To bring an object that already exist in the real world into a computer-generated virtual world, it is necessary to construct accurate shape representation of the real object in a computer system. A traditional method for this is to use conventional modeling software after precisely measuring the size or length of the real object by hand." which suggests using a computer input device to measure the real object in order to have accurate shape representation of the real object's constraining shape. Thus, it would have been obvious to one of ordinary skill in the art at the time of applicants invention to input with the 6 DOF tracker device the 3D coordinates of the constraining shape because the toy block (section 4.1) or surface (section 5.4) need to have their respective constraining coordinates input in order for the virtual object to properly interact with the real objects since this will require less input devices for the user to use and learn how to use and because section 2 at lines 7-14 suggests using a computer input device to measure the real object in order to have accurate shape representation of the real object's constraining shape. To one of ordinary skill in the art the position and orientation of the real objects that will be interacted with the 6 DOF tracker would be efficiently known in advance by using the 6 DOF tracker to measure the real object by the user moving the

6 DOF tracker "by hand". KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007), U.S. Supreme Court No. 04-1350 Decided April 30, 2007, 127 SCt 1727, 167 LEd2d 705.; and

Kitamura further teaches:

an operating unit configured to control the position and orientation of the virtual object based on the constraining shape in accordance with the a user's instruction in case of the operation of the virtual object.(*Sections 5.1 to 5.4 discusses manipulation of the virtual world object based upon constraint conditions based on the shape of the real world object in response to the user using the 6 DOF tracker device. The constraining shape generated from the three-dimensional position information constrains the interaction of the virtual world object with the real world object, see sections 2, 4 to 5.4. The introduction on page 133 second full paragraph discusses augmented reality which synthesizes a virtual object with a real object. Section 5.1 discusses after movement is detected by the 6DOF manipulator the virtual object is moved according to the constraints.*).

Claim 17:

Kitamura teaches an information processing device according to Claim 16, wherein the constraining shape is defined by polygons (*Figure 2's Cubes are formed with polygons.*) and the apexes of the polygons are at positions inputted by the user (*As discussed in the a setting unit above it would have been obvious to use the 6 DOF tracker device to input the constraining shape of the real world object which would input the apexes of the constraining shape of the polygon.*) or the constraining shape is a

plane passing through the positions inputted by the user (*A real sensed surface is a planar real world object whose position is inputted by the user in the setting unit. As discussed in the a setting unit above it would have been obvious to use the 6 DOF tracker device to input the constraining shape of the real world object which would input plane for a surface.*).

Claim 18:

Kitamura teaches an information processing device according to Claim 16, wherein said operating unit performs at least one of the following operations in performing an operation controlling the position and orientation of the virtual object:

a translation operation for causing translational movement of the virtual object based on the constraining shape (*Page 137 column 1 lines 1-3 teaches translation when the virtual object collides with the real surface.*); and/or

a rotation operation for rotating the virtual object on an axis which is a normal vector at a plane where the constraining shape and the virtual object come into contact (*Page 137 column 1 lines 1-3 teaches rotation when the virtual object collides with the real surface.*) (*Page 137 column 1 lines 1-3 also teaches translation and rotation when the virtual object collides with the real surface.*) (For the added "and/" note page 137 column 1 lines 1-3 teaches translation and rotation.)

Claims 1-3:

Means plus function claims 1-3 correspond to device claims 16-18 and the means of Kitamura, software and computer, are equivalent to applicant's means of software and computer.

Claims 5-7:

Step for claims 5-7 correspond to device claims 16-18 and the steps of Kitamura, software and computer, are equivalent to applicant's steps performed by software and computer.

Claims 8 and 9:

Claims 8 and 9 mirror claims 14 and 15 addressed above and they are rejected for the same reasons given above for claims 14 and 15.

Conclusion

9. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
